

MASKOVER™

A positive solution in the face of a pandemic.

The creators of MASKOVER designed a solution that adds an additional barrier between the user's face and external matter.

As HCPs are being directed to wear single-use masks for several days in a row, the outside of the mask becomes contaminated. This single-use solution is biodegradable, lightweight, compatible with all types of masks without affecting the seal, keeping the exterior surface of the PPE covered.

Civilians have been directed to wear homemade masks and are faced with similar contamination risk.

With **MASKOVER™**, we aim to help to ease the pain and strain of PPE shortage worldwide.

Revised Design for easier application!

MASKOVER is an additional barrier between the wearer's face and external matter. Proper use of PPE should always be employed. During times of PPE shortage, HCPs are being asked to use their single-use medical-grade facial masks and/or N95 masks for extended periods of time, over multiple days. This increases risk of self-contamination as well as the spread of pathogens to patients and objects.

A HCP can don MASKOVER over their mask, tend to a patient, discard of their MASKOVER, and don a new one for the next patient. MASKOVER does not affect the fit of the wearer's mask.

The CDC recently advised the general public to start wearing homemade masks. These cloth materials can harbor bacteria and pathogens for extended periods of time. Our single-use MASKOVER should be worn over homemade masks.

Made of 100% recyclable materials. 100% biodegradable.

PATENT PENDING

Packed in Cases of 600.

FOB Green Bay, WI

Available in other styles.
